

Eyemikan Myopia Guardian Services solution to stay away from myopia
 Globally, it is estimated that 50% of 10 billion people will be myopic by 2050. The problem is that parents are unaware when their children's vision deteriorates, and miss the precious golden treatment period because their children check the vision once for a long time. This services solution developed by Eyemikan Biotech Company is in response to combat myopia.

This services plan is to promptly notify parents that their child's vision has deteriorated (reaching critical vision), and contact the partner Eye Doctors for treatment as soon as possible. This solution is composed of the home-based handheld device VisionPet (which has obtained Taiwan invention patent and utility model patent), mobile phone (iOS, Android) App, vision critical computing software (abnormal vision trends - has obtained Taiwan invention patent) and cloud server. Vision testing can be done at any time and stored in the cloud (recommended once a week). After each test, the visual acuity value is uploaded and computed. If the visual acuity value reaches the "visual acuity threshold" set by the parents, the parents will be notified to take appropriate treatment.
